Surface affinity: Applications of a functional assay for quantifying nanoparticle transport, aggregation, transformation and bio-uptake in complex systems

Dr. Mark Wiesner

James L. Meriam Professor of Civil and Environmental Engineering,
Director, Center for the Environmental Implications of NanoTechnology
(CEINT), Duke University

Tuesday, September 15th, 11:00am

Ketcham Auditorium, Lafferre Hall

Environmental transformations and exposure are key elements in determining the environmental and health effects of nanomaterials. Tools for predicting the environmental behavior include functional assays that can be used to evaluate nanomaterial properties in complex *or* reference systems. Simulations show that nanoparticles introduced in a complex, albeit greatly simplified environment exhibit a wide range of behaviors depending on their affinities for each other and their concentrations. The complexity of these interactions appears to be governed by the relative affinity of nanoparticles for each other (autoaggregation) and with background particles (heteroaggregation) and other native surfaces. A functional assay for determining the affinity of nanoparticles for complex mixtures of native particles will be presented. This talk addresses the use of a functional assay for surface affinity, the methods for quantifying surface affinity, and systems where surface affinity is likely to be important in predicting nanoparticle exposure and effects.
